is a Web3 platform for live and recorded events in the metaverse. Organizers can host fully virtual or hybrid events without venue capacity or physical location constraints. They can also create ongoing online experiences and digital goods so that audiences can continue to engage with events, like-minded people, artists, event hosts and guests, and more.

What is MetaShow?

MetaShow removes many of the common points of friction for event management. It uses a decentralized ledger (Cardano) for transactions such as ticket sales, resales, and attendee management. It also enables the creation and exchange of (non-fungible tokens) NFTs for collectibles, memorabilia, and event merchandise. As a result, event organizers, advertisers, sponsors, artists, and attendees can continue to enjoy ongoing monetization from events and NFTs over time. Events can be crowdfunded with an innovative staking model that lowers upfront risks for organizers and performers.

By 2030, it is entirely plausible that more than 50 percent of live events could be held in the metaverse.¹

— McKinsey & Company

Although MetaShow initially focuses on music entertainment events such as festivals and concerts, the approach can scale to many other types of events, including professional conferences, political rallies, art fairs, competition shows, comedy shows, and more. Wherever large numbers of people come together to share a common experience, MetaShow makes sense.

The Story Behind MetaShow

COVID-19 was devastating for everyone in the world of live events. Concerts, festivals, and other productions were indefinitely postponed or canceled. The impact on audiences was disappointing, but it was a crisis for event organizers and live performers, causing financial disruption. Some were not able to survive.

Even though the pandemic brought many issues with live events to the surface, many of the problems had always existed.

- Event venues have limited attendance capacity.
- Attendees do not always have the resources to travel to an event's physical location.
- Coordinating organizers, staff, vendors, and performers requires advance planning, making rescheduling difficult.
- Events have to occur within a fixed amount of time.
- Telecasts, streaming videos, and replays never match the feeling of being there.

The MetaShow founder team includes life-long music lovers with careers in event production (including Eurovision, Tommorowland, Sonar, and the Montreux Jazz Festival). We are also technologists who understand the innovation potential of blockchain and the power of emerging virtual reality/augmented (VR/AR) reality technology.

All of those elements combine into the story behind MetaShow: long-standing limitations in event management, a disruption to live events that we want to prevent in the future, and a founder team with the passion, knowledge, and skills to build what we envision.

Our Impact

MetaShow helps remove some of the most significant risks and limitations from events. It democratizes access while maintaining the specialness and exclusivity that make events such a compelling experience for participants. By layering in the economics of the Cardano blockchain and Web3, MetaShow also distributes the benefits and incentives more equitably to artists and attendees.

In This White Paper

The remaining sections of this white paper will cover:

- The Market Opportunity, including the momentum created by the technologies enabling MetaShow (VR/AR and blockchain) and the potential for adoption
- The Problem Statement, focusing on the needs and gaps for end-user/attendees, event organizers, event services providers, artists, and other talent, and advertisers/sponsors
- The Solution, providing a detailed description of MetaShow use cases and features
- MetaShow Tokenomics, explaining our token supply, issuance, utility, and approach to NFTs
- The Roadmap, detailing our go-to-market approach and technology phases from releasing a minimum viable product (MVP) to future plans
- Founders, Partners, and Funding, illustrating our team strengths and our traction to date

MetaShow sits at the convergence of two of the biggest and most investible technology trends in today's market environment— the metaverse and Web3. At the same time, digital media demographics, attitudes, and usage patterns are changing, converging with new technical possibilities. Many investors, analysts, and industry experts see these separate but interrelated trends as the future of the Internet.

Technology Trends

This paper uses the term “metaverse” to refer to an immersive digital user experience regardless of the technologies used. We use “Web3” to refer to decentralized, blockchain-enabled platforms that leverage smart contracts, cryptocurrencies, and NFTs to represent and exchange value.

Underlying each of these trends is the growth of VR/AR, a specific set of devices and user interfaces that people can use to access metaverses. VR/AR will likely continue to exist in parallel with other ways to access metaverse content and interact with other users, such as browsers and chat servers.

Other technology trends also contribute to the possibility and promise of the metaverse, including distributed ledger technology (DLT), 5G networks, edge computing, graphics engines, spatial audio, content creation tools, display resolution, and processors.

The metaverse represents an enormous growth opportunity, with estimates of a value of \$5 trillion by 2030 according to McKinsey report.¹ The same

report finds investment flows of over \$120 billion into the metaverse space between January and June 2022, more than double the \$57 billion of the entire prior year. By contrast, AI attracted only \$39 billion in investment in its surge year of 2016.²

VR/AR is also experiencing rapid growth. The VR market size could reach \$227 billion by 2029, at a compound annual growth rate (CAGR) of 45.2%.³ AR is projected to grow to \$98 billion by 2028 at a CAGR of 48.6%.⁴ The 5G network coverage rate is also a relevant factor, given the bandwidth needed for immersive experiences and the broad user preference for mobile devices. According to equipment manufacturer Ericsson, 5G is expected to cover 75% of the world's population in 2027.⁵

Across the board, the market opportunities for both the core and enabling technologies for the MetaShow platform are at a tipping point. This convergence is a critical time for early innovators and investors to tap into promising opportunities to achieve growth and leadership.

User Trends

The global live events industry market size, including concerts, festivals, conferences, and exhibitions, has been valued at \$886.99 billion (as of 2020) and is projected to reach \$2.2 trillion by 2028, growing at a CAGR of 13.5%.⁶

Live music events alone are a significant market with solid growth potential. Globally, they represent approximately \$28 billion in value when omitting the impact of COVID-19.⁷ Separate market research projects this segment to grow at a 6% CAGR (i.e., by nearly \$3 billion) between 2020 and 2025.⁸

¹ <https://www.mckinsey.com/-/media/mckinsey/business%20functions/marketing%20and%20sales/our%20insights/value%20creation%20in%20the%20metaverse/Value-creation-in-the-metaverse.pdf>

² <https://www.mckinsey.com/-/media/mckinsey/business%20functions/marketing%20and%20sales/our%20insights/value%20creation%20in%20the%20metaverse/Value-creation-in-the-metaverse.pdf>

⁷ <https://www.statista.com/statistics/1096424/live-music-industry-revenue-worldwide/>

⁸ <https://www.technavio.com/report/live-music-market-industry-analysis>

In theory, MetaShow is able to address this entire market, starting with live music and expanding to other events as it builds traction.

Demographic and cultural changes are also contributing to the growth of the market opportunity for MetaShow. The adoption of gaming continues to climb, estimated to exceed 3 billion gamers by 2023⁹. This trend suggests more and more people are willing to engage with digital experiences for entertainment.

Moreover, negative views of “big tech” companies such as Facebook/Meta and Google continue to rise. In the U.S., a Gallup survey found positive views

falling to 34% in 2021¹⁰. The steady increase of EU regulation of big tech companies shows mounting distrust¹¹. These reputation issues may help pave the way for greater adoption of decentralized platforms, especially those that can explain the benefits clearly and make features accessible for the average consumer.

The rise of interest in virtual worlds also points to high market potential. A global survey of nearly 3,000 consumers found that almost 60% are eager to shift some activities to the virtual world. Shopping and attending events rank at the top of their list of preferred activities.

Consumers are looking forward to shifting a range of their activities to the virtual world.

Preference for at least one activity in immersive world compared to physical alternative, % of respondents

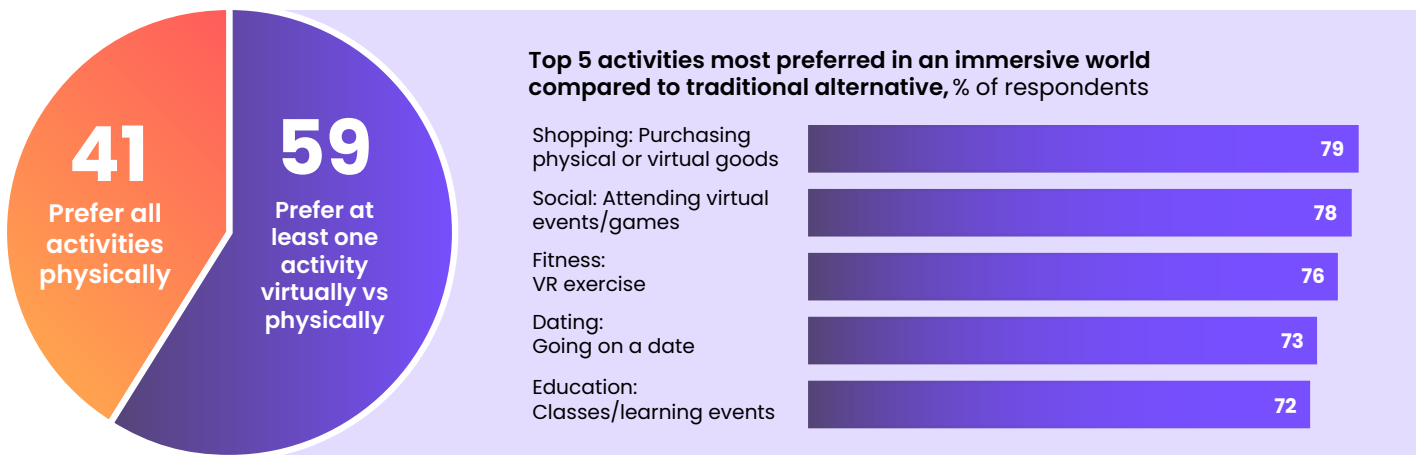

Figure A: Consumer Preferences for Metaverse Experiences¹²

Summary of MetaShow’s Market Opportunity

Just like e-commerce and social networking in previous waves of digital innovation, new technical possibilities are intersecting with changes in consumer behavior and the overall culture. These paradigms do not replace the old.

Instead, they add to what’s possible. MetaShow will capitalize on these converging opportunities to lower the barriers to attending events, make them more engaging, and create opportunities for people to build and maintain powerful new shared experiences.

Problem Statement

Real-world events can be fun and engaging for their audience. They can be money-makers for event organizers and featured talent. They can help talent, advertisers, and sponsors get exposure. But they do not scale. They can require complex logistics and cause a lot of frustration.

The Wall Street Journal reported that major musical artists in the U.S. were seeing no-show rates of 20% or more, with fans who purchased tickets choosing not to attend on the day of the event. That figure is nearly double the rate of no-shows from before the pandemic. Smaller club and theater shows saw rates as high as 25% to 30%.¹³ Even as the global pandemic was lifting, venues and organizers started to see a longer-term behavior change.

A closer look at the potential frustrations of live events shows that there are many points of friction for event audiences. Organizers, artists, and advertisers/sponsors also have to make tradeoffs when it comes to live events.

“Overcoming frustration and limits to scale is what MetaShow is all about—for everyone involved.”

— Mark Jivko, MetaShow

Friction and Limits to Scale with Live Events

	Overcoming Frustrations	Adding New Value
 Audience	- Travel to event location - Cost - Last-minute cancellation - Passive	- Immersive experience - Digital collectibles and resale - Replay - Engage with others post-event - Ways to interact with performers
 Organizers	- Capacity limits - Permits and licensing - Event staffing - Potential cancellations - Ticket fraud	- Repeat revenue from streaming and replays - Innovative offers to artists/ advertisers/ sponsors - Metaverse land plots and customization
 Artists	- Travel and setup - Limited engagement with fans	- Post-event revenue - Wider exposure - Issue NFTs for events and artist exclusives
 Advertisers/Sponsors	- High cost - Exposure limited to date and time of event	- Ongoing exposure (replays and other post-event impressions) - Greater opportunities for creativity with digital - Data and analytics

¹³ <https://www.wsj.com/articles/major-music-acts-are-seeing-20-no-show-rates-at-concerts-11639663201>

Overcoming Frustrations

For members of the **audience**, attending an event requires a lot of time and money for everything from travel or commuting to the cost of tickets and concessions to the potential risk of sickness or other issues causing people to miss an event they already paid for and looked forward to attending.

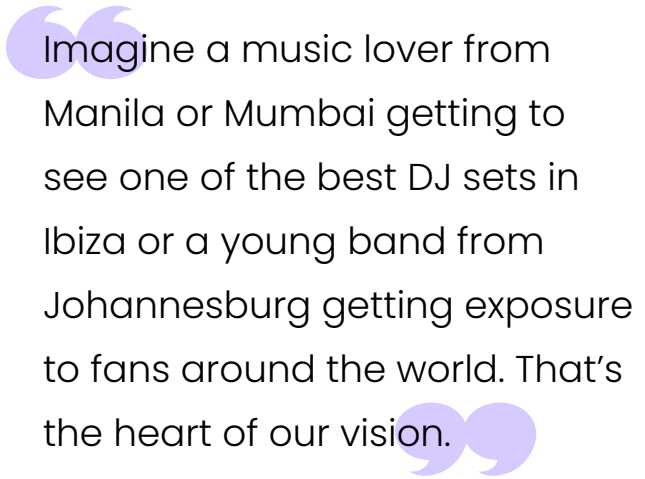

In addition, for most ticket holders, participation is limited. Most people cannot freely roam a venue, experience VIP lounges, or go backstage. Whether because of assigned seating or a crowded floor, many attendees do not have the freedom to move around as much as they would like.

By removing many of these physical boundaries and constraints, MetaShow gives audiences more room to move around and explore.

Event **organizers** must also expend enormous effort and resources to coordinate an event successfully. After securing a venue and staffing it, their revenue is limited because even the largest physical spaces have capacity limits. Even though outdoor spaces can often accommodate more attendees, they require various permits to operate. In addition, they usually do not have the flexibility to run at late hours or for additional days because of local ordinances and officials.

By creating immersive, virtual experiences, MetaShow organizers can overcome these limits of space and time, increasing attendance, adding virtual pre- and post-show events, or further monetizing virtual venues by renting them out to other events.

For **artists**, live events can be a mixed blessing. Even though they make the bulk of their money from touring¹⁴, tour schedules and logistics can be grueling. In addition, the setup of a live event makes it difficult to engage with many fans beyond the performance itself. Musicians, performers, speakers, or other event artists can

Imagine a music lover from Manila or Mumbai getting to see one of the best DJ sets in Ibiza or a young band from Johannesburg getting exposure to fans around the world. That's the heart of our vision.

— *Gianluca Allaria, MetaShow*

only meet and interact with a tiny percentage of the people who came to see them.

By creating ongoing engagement before and after events and supporting event-specific promos and limited editions such as digital downloads and NFTs, MetaShow helps artists engage and earn money beyond the confines of a single night's show.

Finally, **advertisers and sponsors** can create visibility for themselves, but they have to invest significant budget and resources into creating on-site experiences to achieve results. Their direct exposure to consumers is limited to the date and time of event. In many cases, the return on investment mostly comes from soft factors such as brand recognition or word of mouth.

The virtual environment and the tokenomics of the MetaShow ecosystem open up many possibilities for creativity, brand experience, and direct consumer relationships for brands.

¹⁴ <https://www.businessinsider.com/musicians-received-12-percent-43-billion-generated-by-music-industry-study-2018-8>

New Value for Everyone

In addition, using the MetaShow platform also allows audiences to have innovative experiences while creating new benefits for organizers, artists, and advertisers/sponsors. These benefits simply do not exist with physical experiences.

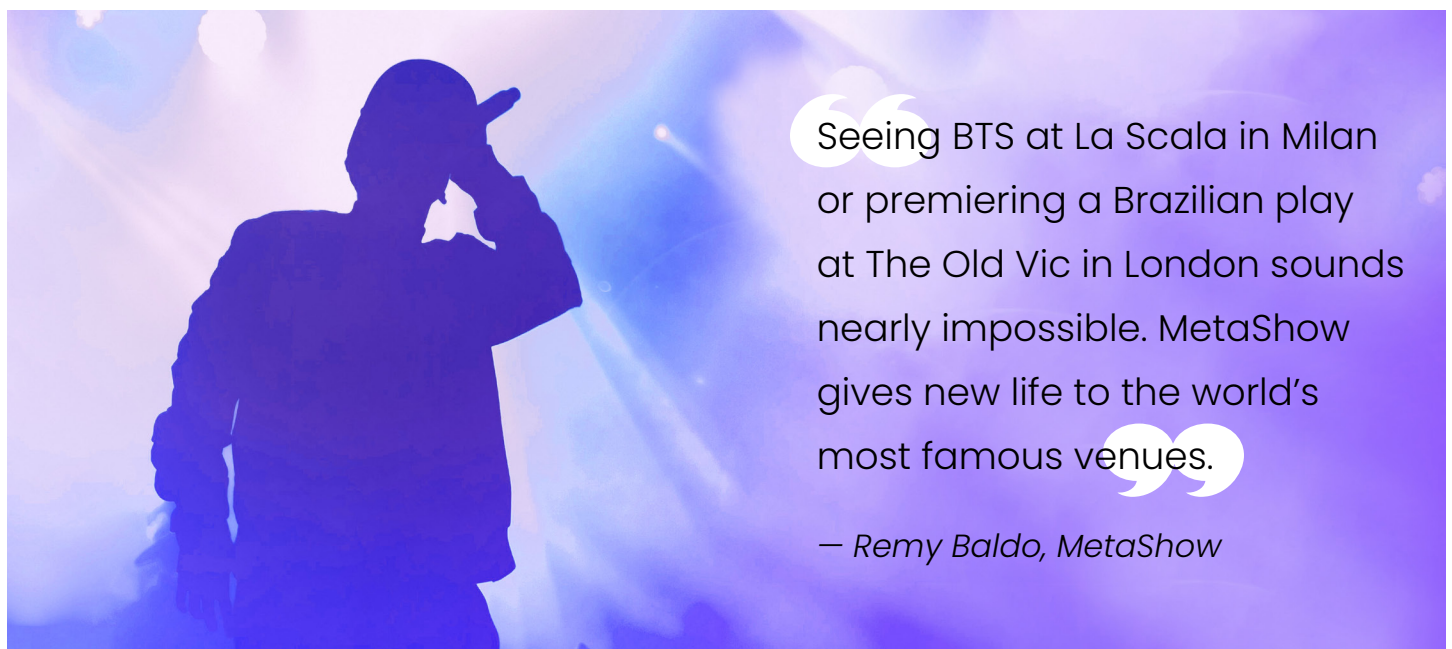

In a metaverse environment like MetaShow, **audiences** can have an immersive experience that allows them to fund, play, and replay an event, exploring different elements of the event such as lounges, backstage areas, or artist meet-and-greets. They can also go beyond the merchandise table with digital collectibles such as live versions, remixes, badges, and other exclusive content. They can also participate in an active secondary market by trading their NFTs while artists and others still get a fair share of such sales.

MetaShow also gives event **organizers** many more revenue streams from replays and ongoing merchandise sales, customizing virtual spaces for artists, advertisers, and sponsors, or leasing popular metaverse plots in innovative ways. It also allows organizers to fund events by inviting

users to stake tokens in event-specific stake pools, creating shared benefits between organizers and audiences.

Artists have been struggling with the changing economics of music sales for many years. MetaShow helps cut through some of the inequities. In 2017, a Citigroup report found that artists received 12% of the \$43 billion that the music industry generates, most coming from touring. On average, ticket sales account for almost 90% of the revenue artists receive from their fans¹⁵. MetaShow events give artists more of a sustained direct line to their fans and help them capture new audiences beyond geographic boundaries.

Finally, MetaShow gives **advertisers and sponsors** many benefits beyond off-site activations or experiential setups at live events. Over \$84 billion was spent on experiential marketing in 2019¹⁶. But maintaining engagement and measuring impact can be challenging. Brand activations in the metaverse allow for longer-term exposure, more opportunities for creativity, and better data capture about what consumers do after interacting with a brand at an event.

Seeing BTS at La Scala in Milan or premiering a Brazilian play at The Old Vic in London sounds nearly impossible. MetaShow gives new life to the world's most famous venues.

Detailed Description of MetaShow

The MetaShow platform delivers live and recorded concerts as well as other events in the MetaShow metaverse, primarily using VR/AR technology. It will allow users to attend events, help organizers fund, design, and host hybrid virtual and live events or purely virtual events, and provide features for artists and advertisers/sponsors.

MetaShow will be developed for the Oculus™ Quest 2 headset by Facebook (Meta) for our initial MVP (minimum viable product), leveraging its massive market share of 78%¹⁷ to reach a large testbed of users. Events will use volumetric video, viewable from any angle, with realistic depth, color, and lighting. Over time, we will add VR apps for Steam, a gaming platform with an estimated 120 million active monthly users¹⁸, and enable WebGL 3D browser-based access for users without headsets or other means of access.

The platform uses the Cardano blockchain to track event attendance, sales, and other financial transactions such as NFTs and participating in event-specific stake pools for rewards from tickets to collectibles.

Imagine the value of an NFT ticket with a full VR experience capturing the legendary 1985 Live Aid concert by Queen.

— Jonathan Martinez, MetaShow

MetaShow Use Cases

	Overcoming Frustrations	
 Audience	- Create accounts - Pay-per-event and pay-per-view - Immersive, geographically unrestricted virtual experience - Crowdfund events	- Buy and resell NFTs (tickets, upgrades, and collectibles) - Interact with other users - Earn rewards (tickets or other NFTs) by staking ADA into event pools - Unlock additional artists for the event
 Organizers	- Organize virtual events - Sell NFT entrance tickets and digital merchandise - Create stake pools for events	- Book artists based on size of stake pool - Rent digital venues to organize an event
 Artists	- Play during live shows - Earn additional revenue	Sell NFTs collections before, during, and after events
 Community/DAO	Vote on proposals to build future digital venues	
 Advertisers/Sponsors	- Buy ad space or virtual promotional areas - Set up virtual booths and concessions - Customize spaces with branding	- Give away and sell merchandise - Buy data sets
 Creators/Investors	- Receive 20% of sales and 5% of royalties on secondary market sales - Buy, sell, and lease NFT metaverse plots and other 3D assets in MetaShow

¹⁸ <https://www.statista.com/statistics/308330/number-stream-users>

 CARDANO**Use of the Cardano Blockchain**

Cardano will be a core element of MetaShow. However, we recognize that overall blockchain adoption is very low, estimated at less than 1% of the world's population.¹⁹ Cardano itself has an estimated 500,000 users.²⁰ To accommodate this situation, event attendees will be able to purchase event tickets and other merchandise directly from their Oculus headsets using their connected credit card as well as their personal crypto wallet (preferred for accessing all MetaShow features).

Why Cardano?

Cardano is a third-generation blockchain protocol that supports NFT minting and token issuance. It has a blooming ecosystem of dApps and a very active and engaged community. We selected Cardano because the Cardano ecosystem fosters a culture based on academic peer-review and formal verification. In addition, it emphasizes security, reliability, and sustainability around its finished product, and we believe it is scalable to our project needs. Cardano is the ecosystem best positioned to allow us to use staking pools, easily mint native tokens for MetaShow activities, and support the creation of NFTs.

Native Tokens

Cardano supports user-defined tokens, allowing organizations to create tokens to provide a medium of exchange within their business model. Such tokens exist on the same layer as the ADA coin, using the base accounting ledger for transacting, making them native tokens. This approach offers several advantages over non-native, smart contract-based tokens, such as ERC-20 tokens. Non-native tokens create their own local account ledger, with proprietary rules on how to mint and transact the token.

¹⁹ <https://www.container-xchange.com/blog/blockchain-shipping/>

²⁰ <https://www.statista.com/statistics/1278693/ethereum-active-addresses/>

The lack of peer review can make this model more prone to bugs and hacks. By existing on the base layer, native tokens are generally more efficient and secure than non-native tokens and adopt a majority of the features of the ADA coin, including governance features once implemented.

MetaShow will create its own native token to facilitate exchange between attendees, organizers, artists, and advertisers/sponsors. In addition, Cardano supports bundling tokens, (i.e., sending fungible and non-fungible tokens in a single transaction). This model is a significant advantage for transacting in the metaverse, where a set of NFTs are often grouped in exchanges, for example, an avatar with added shoes and clothing or digital downloads accompanying an event ticket).

Stake Pools and Delegation

On Cardano, validators earn rewards in the form of ADA (the primary Cardano token and the seventh-largest cryptocurrency by market cap)²¹ by running nodes that operate and secure the network. However, this requires knowledge and resources. To invite more egalitarian participation, Cardano also allows users to delegate their ADA to another validator if they lack the technical knowledge or desire to run a node themselves.

In exchange, the delegator receives a share of the total staking rewards that go to the validator, proportional to their ownership of the total ADA staked by the validator, minus operating fees. For this reason, validators are referred to as stake pools because they pool the stake of many delegators into a single validator. The person/organization that runs the validator is called the stake pool operator (SPO).

User Experience

Audio

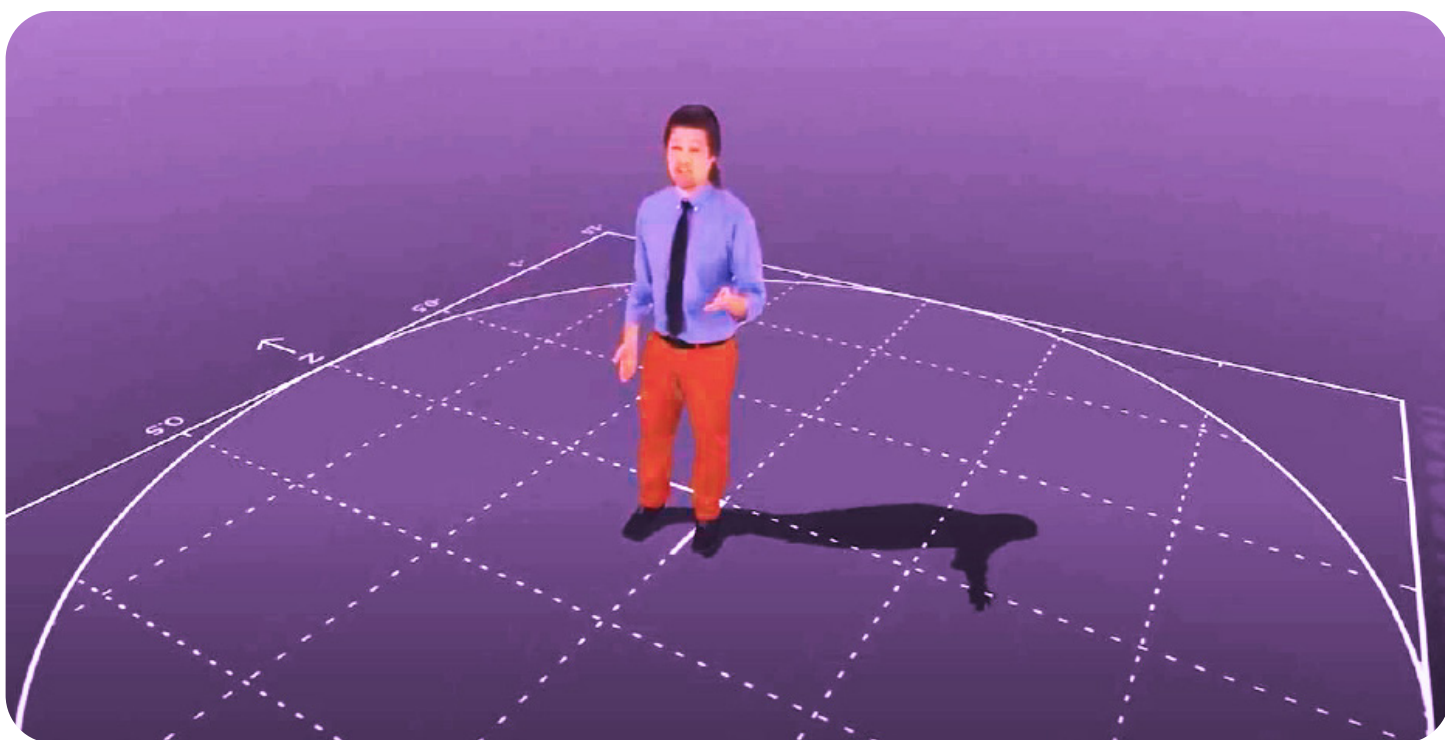

With our initial focus on live performance (bands and DJs), our top priority will be to deliver the highest quality spatial audio²² from our artists and partners so that users can enjoy a realistic experience. Using certified Oculus SDKs for Spatial Audio will allow us to capture the most out of concerts and other events where audio quality is critical. Audio and video layers will be transmitted independently, with the audio layer receiving a performance boost because audio compression or loss is more evident than transitory video quality changes.

The next phase will incorporate real-time voice chat for groups attending live events, complete with audio controls for each group member.

²¹ <https://coinmarketcap.com>

²² See Appendix 2 below.

(Image Source: Arcturus)

Volumetric Video

Volumetric video will provide a realistic end-user experience efficiently and cost-effectively as metaverse technologies mature. This technology has already seen traction in the market and is expected to grow to a nearly US\$ 5 billion market by 2026.²³ Many “big names” in tech and entertainment have already begun developing volumetric capabilities and products, including Microsoft, Intel, Epic Games, Paramount Pictures, and Arcturus.²⁴

With volumetric capture, multiple cameras and censoring devices can capture performers and other elements of a performance stage. During post-production, this data is converted into a volumetric video, which offers realistic depth, color, and lighting—from any angle.

Both capture and streaming can be accomplished using existing technologies and toolkits. The resulting output provides an immersive experience consumable on VR equipment as well as 2D devices such as computer monitors and smart-phones. The next step will be to supply select pilot audiences with pre-recorded 360° video in order to assess performance indicators such as bandwidth utilization, latency, and frame drops, as well as to monitor and troubleshoot desynchronization issues.

Finally, we will launch real-time 360° broadcasts as the primary MetaShow format, with fallbacks ready for 2D rendering for users who face connectivity issues.

²³ <https://www.marketsandmarkets.com/Market-Reports/volumetric-video-market-259585041.html>

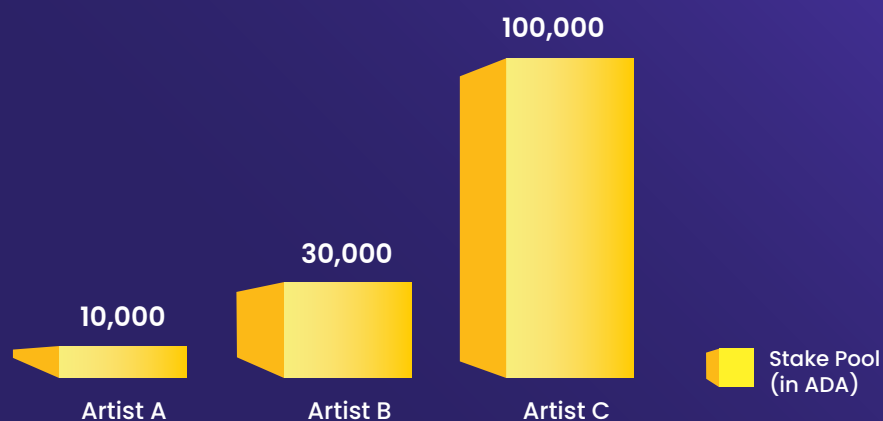

²⁴ <https://arcturus.studio/blog/2022/04/05/what-is-volumetric-video/>

Event Funding Experience

Using the MetaShow platform, event organizers can set up ADA staking pools, making use of a key advantage of Cardano. Liquidity pools produce ADA incentives for all parties involved during the staking period, with revenue distribution based on predetermined percentages.

Stake Pool (in ADA)

Increasing funds in the stake pool allow the event community to unlock artists with higher booking fees or bigger fan bases.

Ticketing Experience

In the world of live events, once a ticket is sold, it only has value until the event begins, after which it becomes useless. NFTs can increase in value over time for their owners as well as the artists and show organizers. Tickets, merchandise, character customization, and other NFTs generated within the MetaShow app will be tradeable. Using an NFT approach to tickets can allow users to re-attend events, exchange and collect tickets as well as other collectible digital goods, and use tickets as tokens inside partner projects such as Web3 games and other metaverse apps.

Using NFTs for ticketing solves many of the challenges and issues that frustrate audiences, event organizers, and artists. In the traditional world of ticket sales and distribution, ticket purchasers sometimes have difficulty with reselling tickets for face value or higher if needed. At other times, resale tickets are available, but their authenticity is questionable. In May 2022, violence broke out at the Champions League final between Liverpool and Real Madrid stadium, in part due to massive ticket fraud.²⁵

MetaShow's ticketing solution will support access to virtual events in the metaverse and access to live event venues. Organizers can create NFT tickets that give access to both digital and live events. MetaShow will develop a companion app for organizers to help control access and provide fraud protection because tickets are recorded on the blockchain to validate authenticity and track ownership history.

Audience members also benefit from a tokenized ticket experience. MetaShow's ticketing solution reduces costs as well as risks of fraud and scams. It takes unnecessary intermediaries out of the picture. Organizers can produce tickets faster and at lower cost. Attendees can more easily validate the authenticity of tickets, and easily trade their tickets on the secondary market. Ticket resales

benefit artists and event organizers as well via resale royalties, unlike traditional large-scale ticket distributors where only the ticket purchaser has resale gains or losses, and in both cases, they lose a percentage to ticket resale platforms.

Finally, NFT ticket holders can earn rewards on their tickets such as digital memorabilia, exclusive experiences, and event perks. Tickets themselves can become collectibles, with organizers and artists creating digital art that creates more of an emotional bond and sense of exclusivity.

Recipient	Distribution
Artists	14%
MetaShow	12%
Event organizer	25%
Venue owners (Venue NFT)	24%
Staking pool	7%
Ecosystem treasury	10%
Burning fund	8%

NFT Proceeds Distribution

MetaShow's automated on-chain smart contracts will distribute royalties with each transfer so that artists and performance organizers can earn in perpetuity from all NFT resales.

Likewise, attendees who purchase NFT tickets will also have the option of participating in the event pool, so that they become active participants in funding the event rather than passive ticket purchasing (see above).

Of each NFT ticket sale, 8% will go to the burning fund stake pool. Staking will generate ADA rewards for each epoch, which we will use to buy tokens and burn.

²⁵ <https://www.france24.com/en/france/20220530-french-minister-blames-ticket-fraud-for-stadium-violence-in-champions-league-final>

Artist Rights

There is no platform without content. MetaShow will make artists' rights a core element of the platform so that artists can benefit from additional revenue and opportunities to grow their fan base. Many artists will also use MetaShow as a creative opportunity for custom-designed sets, light shows, and other experiential elements that would be cost-prohibitive for physical events.

Our Principles for Artists

- Managers and artists will have complete transparency on additional revenue and revenue sharing opportunities.
- Artists will receive an equitable percentage of total revenues.
- We will offer flexibility on availability windows, geographic restrictions, availability of replays, etc.
- We will help artists realize their vision for live shows with the unlimited possibilities of virtual worlds.

Investor Experience

Building or buying an event venue is costly and complicated. Major theaters are typically located in expensive urban environments. Outdoor festivals require major planning, permitting, and logistics. These factors make it nearly impossible for smaller investors, groups, or fans to play a part and reap the financial rewards with real-world venues.

MetaShow helps democratize event investment so that it can be accessible to people or groups with fewer resources. We will sell collections of NFTs for ten event venues in our first year, and add additional venues over time. These venues can be digital festival sites, theaters, nightclubs, or public attractions such as beaches or parks. Each venue will be owned by an exclusive group of NFT holders. They can earn royalties passively (20% of NFT ticket sales) or by holding their shares or gain active returns on their investment by renting or reselling their shares.

Users stake tokens to:

- Get more rewards
- Access data monetization
- Access NFT land-plot participation
- Earn NFT collaborations with partners
- Earn redistribution of 20% of the platform fees

Users use tokens to access services in the metaverse:

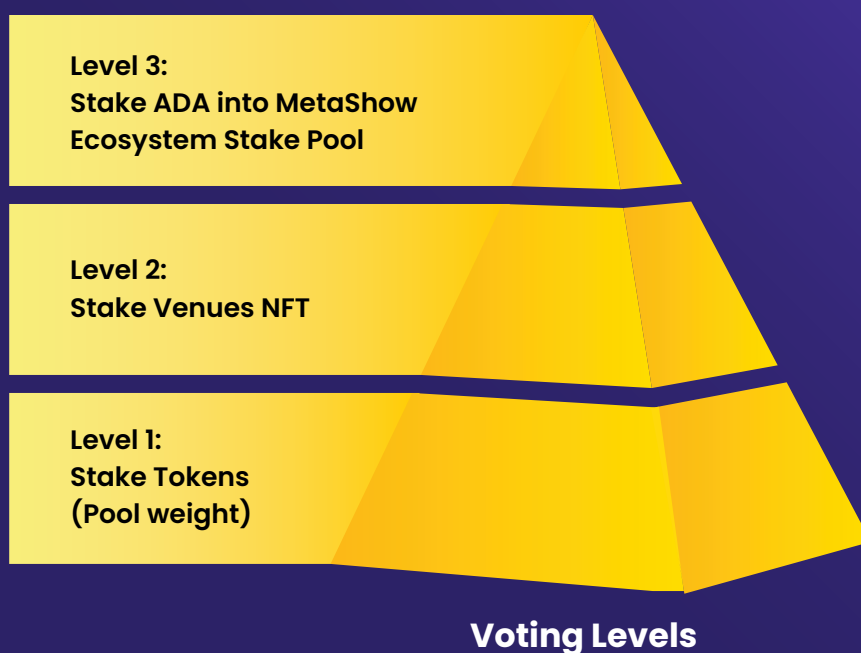

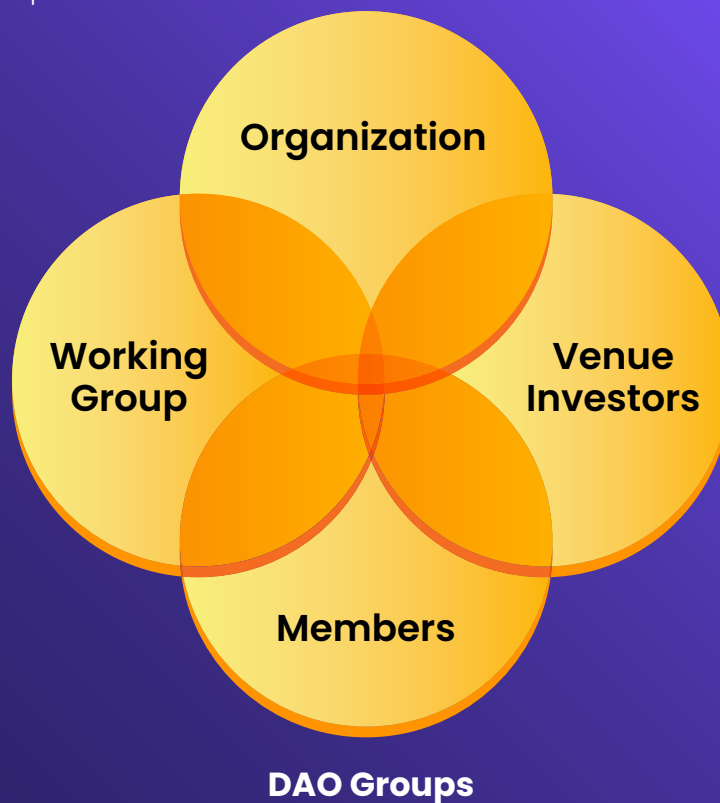

- For discounts on tickets & goods
- For purchasing digital goods & items
- To buy and rent land plots
- To trade tokens for profit

Businesses buy tokens to access services such as:

- Placing ads, either general or targeted
- Buying data sets
- Renting business booths

DAO Structure

The MetaShow DAO will include four groups and three levels of voting requirements.

Summary

Go-to-Market Strategy

Appendix 1: Team, Partners, and Funding

Team

Gianluca Allaria (CMO)

A 15-year career in international media, with a specialization in live music and a strong background in production and marketing.

Allaria has worked for organizations such as Eurovision. He has also negotiated broadcast rights for festivals including Tomorrowland, Sonar, and the Montreux Jazz Festival.

Mark Jivko (CTO)

An accomplished Chief Technology Officer with more than years' experience as a software developer and leader.

He is skilled in Software Architecture, Software Development and Startups. Previously CTO and Co-Founder of Stephino Software, a studio with over 100 million app downloads in 6 years, He is also the sole developer of numerous Open Source projects.

Remy Baldo (Strategy & Business Development)

Ten years' worth of experience in event production for the electronic music industry, managing teams and creating the identity of events.

Baldo is also the founder of genius yield.

Jonathan Martinez (Partnerships & Funding)

A 20-year track record in organizing events of all sizes from festivals to exclusive private shows.

Martinez has worked with festival founders and promoters as well as artists and their management. In addition, he acts as a technical advisor and team manager. As a blockchain enthusiast for two years, he understands how to innovate in all aspects of an entertainment event regardless of its size.

Partners

GENIUS^x is an accelerator program launched by the world-class team behind Genius Yield. The goal is to foster innovations on Cardano by providing early-stage blockchain startups with all the tools they need to become successful—not only by connecting them to investors but by offering technical mentorship and business guidance as well.

MOVE.AI is a platform for high-fidelity real-time motion capture from video. It extracts natural human motion from video using advanced AI, computer vision, biomechanics, and physics, automatically retargeting the data for AR/VR devices. Move AI technology eliminates the need for expensive and inaccurate motion capture suits and streamlines workflow for generating characters for the metaverse.

Appendix 2: The Current State of VR Technology

AR and VR are on the verge of becoming commonplace. Since the earliest VR systems of the 1960s, technologies have improved while becoming more and more affordable, thanks to advances in networks, optoelectronics, and microelectronics.

In terms of optoelectronics, VR displays evolved from CRT to TFT-LCD/AMOLED, with ever-decreasing screen volume and weight, enhanced resolution to FHD+, and response time lowered to microseconds. In terms of microelectronics, the widespread adoption of low-cost SOC chips and visual processing units (VPUs) has turned the integrated circuit field into a hotbed of VR development.²⁶ Innovation has occurred on several fronts.”

Immersion

High angular resolution and a wider field of view are required to improve user experience and reduce dizziness. The following sources of VR dizziness are widely accepted in the industry: image quality, conflicts between vision and other senses, and vergence accommodation conflict (VAC), which occurs when binocular parallax produces 3D effects but fails to adjust the binocular focus to the visual depth of field. Because VR head-mounted displays require a higher level of detail, a high screen resolution aperture ratio is necessary to avoid the screen-door effect. In VR, a 4K+ resolution is urgently needed, which is not required by smartphones.²⁷

In-depth research on VR dizziness has begun at multiple universities, including the Beijing Institute of Technology, in terms of content design, individual variances, and VR software and hardware.²⁸

Tracking

From outside-in to inside-out position tracking, tracking and positioning technologies are evolving from marker-based to non-marker-based scenario segmentation and reconstruction. Scenarios are a crucial difference between VR and AR because the majority of AR content is based on real-world scenarios. The primary goal of AR perception and interaction is to recognize and comprehend real-world settings and objects, as well as to add virtual things to these scenarios with greater verisimilitude. Achieving this requires comprehending the environment using machine vision.²⁹

In the field of perception and interaction, improving the consistency of all sensory channels and the immersive experience of VR users is essential. The consistency of multi-channel interaction refers to the relationship between proactive motions and motion feedback, as well as between sensory channels such as vision, auditory sense, and tactile sense. To meet the criteria for dizziness control and immersive experience, interaction technologies such as immersive sound field, eye tracking, tactile feedback, and voice interaction are essential requirements in the VR field.³⁰

Bandwidth

Access network, bearer network, data center network, network transmission operation, maintenance and monitoring, projection, and coding and compression are all essential network transmission technologies needed for VR/AR. At present, 5G promises a totally immersive VR experience thanks to its ultra-high bandwidth, ultra-low latency, and ultra-high mobility. In addition, hardware improvements are being implemented across the board, from data centers to Internet Service Providers and WiFi bandwidth of headsets.³¹

Rendering

Rendering refers to the ability to produce digital artifacts that are reasonable facsimiles of objects in the real world. From equiangular projection (ERP) to polyhedral projection, projection technology advances. The spherical information that users see in VR must be converted into a planar media format, which necessitates the employment of projection technology. However, image distortion is a possibility, and compression efficiency is limited. This projection method is used by content producers such as YouTube, Oculus, Samsung Gear, Youku, and iQIYI to create VR 360-degree media files.³²

New technology will likely eclipse ERP, such as polyhedral projection. It comprises hexahedral, octahedral, icosahedral, or pyramid projection and has minor distortions and good compression efficiency. Samsung presented recommendations for polyhedron projection formats at the Moving Picture Experts Group (MPEG) conference in 2016. Innovation and commercialization are ongoing.³³

Head-Mounted Displays

In virtual reality, Head Mounted Displays (HMDs) are required for tracking, rendering, and displaying, features essential for making virtual reality “real.” Tracking, which detects motions and causes the visuals to redraw, is required to have a sensation of presence in a virtual world. Optical, magnetic, and ultrasound tracking are the most common methods of tracking (depending on the installation). The tracking system locates and records information about the user’s location and orientation. Because it needs to know where the user is located and looking, tracking is crucial. When a user moves their head in virtual reality, the entire scene must be updated and re-rendered to reflect the new point of view.

Spatial Audio

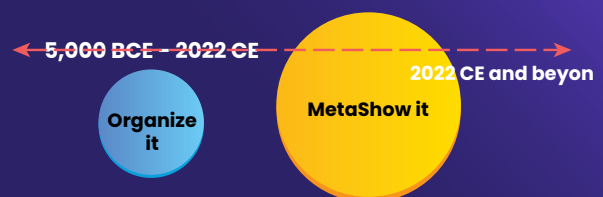

Spatial audio is any audio that is not monophonic (i.e., emanating from one channel). As a result, stereo audio (audio recorded and mixed in separate left and right channels) is the most familiar form of spatial audio. Unlike stereo audio, the sound in spatial audio is confined in space rather than to the listener’s head. Sound remains spatially locked to the listener’s surroundings. Achieving this effect requires mixing and adjusting audio with coordinate data that alerts the system to subtle head movements in order to generate spatial audio.

Conclusion

The world is more connected than ever, but live events have remained in the 20th century.

MetaShow brings the fun, engagement, and interaction of the metaverse into live events of all kinds.

Breaking through the space and time limitations of live events... MetaShow is more than just a platform. **It’s a new verb.**
